OUTDATED BLUEPRINTS LEAVE TODAY'S CLOUD ARCHITECTURES VULNERABLE TO ATTACKS

While cloud adoption has skyrocketed, many security postures are still stuck in the past. Extending legacy, on-premises security tools to work in the cloud has proved to be inadequate, leaving cloud architects and DevOps teams without a clear blueprint for securing applications, workloads, and infrastructure.

Establish a strong security foundation with Amazon Web Services (AWS) and CrowdStrike—a leader in cloud-delivered workload protection. The combination of CrowdStrike Falcon and AWS Security Hub delivers centralized and automated management of threat alerts from AWS services such as Amazon GuardDuty. With Falcon, you can enhance the security of your AWS workloads and uphold the Model of Cloud Security.

**AWS PROTECTS
YOUR CLOUD
INFRASTRUCTURE**

AWS SECURITY HUB DELIVERS A COMPREHENSIVE VIEW OF SECURITY ALERTS AND COMPLIANCE

- Aggregate alert data from Falcon and native AWS services like Amazon GuardDuty
- Monitor the status of your AWS infrastructure through visual displays
- Conduct compliance checks

CROWDSTRIKE FALCON PROTECTS YOUR AWS WORKLOADS THROUGH A SINGLE LIGHTWEIGHT AGENT

- Eliminate modern threats with next-generation antivirus, endpoint detection and response (EDR), IT hygiene, and a 24-7 managed hunting service for better protection
- Simplify your security stack with a single agent that has small footprint on AWS resources for better performance
- Shrink the amount of architecture necessary for full security visibility and reduce complexity to derive more value from your AWS investments

FALCON AND AWS BUILD SEAMLESS SECURITY INTO YOUR WORKFLOWS

Falcon integration with AWS Security Hub enables a comprehensive, real-time view of high-priority security alerts. CrowdStrike's API-first approach brings together Falcon and AWS Security Hub, making it easier for your entire team—including DevOps, CISO, cloud architects, and operations—to automate security tasks and improve overall protection.

BETTER THREAT PROTECTION

Falcon protects your AWS workloads across the entire threat lifecycle by combining machine learning, artificial intelligence, behavioral analytics, and proactive threat hunting in a single solution.

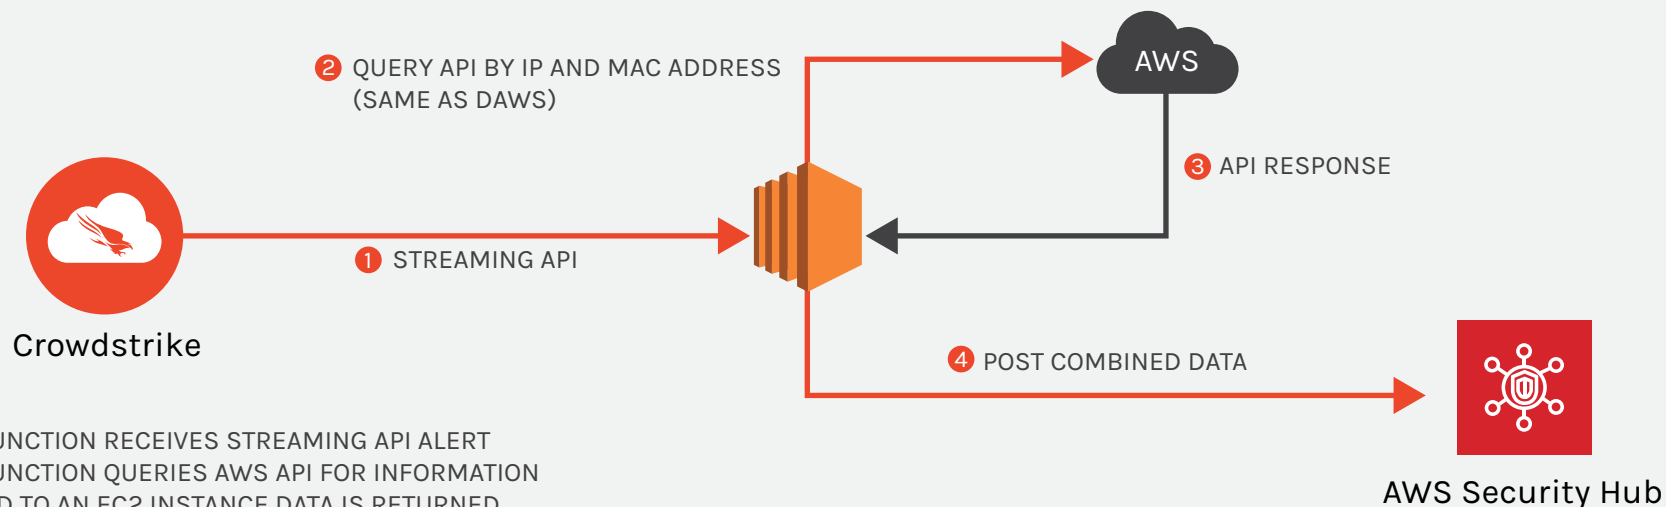

BETTER PERFORMANCE

Falcon works everywhere—Amazon Elastic Cloud Compute (Amazon EC2) instances, Amazon Elastic Container Service (Amazon ECS), and Amazon Elastic Kubernetes Service (Amazon EKS)—providing workloads security even when workloads are offline.

BETTER VALUE

Falcon simplifies complex DevSecOps pipelines and increases operational reliability by simplifying cloud architectures. Falcon consolidates your endpoint agents with an extensible platform that grows and adapts to your needs without adding complexity.

1. LAMBDA FUNCTION RECEIVES STREAMING API ALERT
2. LAMBDA FUNCTION QUERIES AWS API FOR INFORMATION
3. IF MATCHED TO AN EC2 INSTANCE DATA IS RETURNED
4. EC2 AND CROWDSTRIKE DATA IS COMBINED, FORMATTED AND SENT TO AWS SECURITY HUB

BETTER THREAT PROTECTION

With alerts from Amazon GuardDuty and Falcon, aggregated through AWS Security Hub, your team has a single pane of glass view that delivers the situational awareness necessary for strategic security and resource decisions. Automating routine security analysis speeds up your ability to find and address the most critical incidents among the noise.

LEVERAGE CROWDSTRIKE THREAT GRAPH INTELLIGENCE

Discover potential threats quickly and accurately with AI-powered Threat Graph intelligence—achieving a level of protection for your AWS workloads previously not possible.

AUTOMATE SECURITY TASKS

Without Threat Graph, analysts would have to manually gather endpoint telemetry, add intelligence feeds, write correlation rules, and finally pivot the data to determine how security events might be related. But with Falcon, all the intelligence, events, and their relationships are captured in one place, enabling security administrators to automate analysis for smarter and deeper visibility when investigating potential breaches.

INTEGRATE SECURITY INTO CI/CD PIPELINES

Falcon enables cloud security teams to keep up with the dynamic and flexible nature of AWS workloads. Seamless support for CI/CD deployment workflows comes through powerful APIs and streamlined integration with AWS Security Hub.

DEVOPS TEAMS DRIVE MORE AUTOMATION

- ✓ Automate delivery of development pipelines
- ✓ Reduce the complexity of deployment and management
- ✓ Achieve security at the speed of application delivery

SECURITY TEAMS GAIN DEEPER INSIGHTS

- ✓ Add more context to your AWS security alerts
- ✓ Understand the impact of security events
- ✓ Simplify incident response
- ✓ Identify intent based on indicators of attack
- ✓ Reduce false positives and increase security efficiencies

3+ TRILLION
events/week

4.5+ PB
global telemetry

140+
adversaries tracked

135+ MILLION
IOA decisions per minute

BETTER PERFORMANCE

One sensor to protect all your endpoints—from IoT devices, to laptops, to cloud workload devices. Falcon enables a 25X reduction in resource utilization compared to traditional security and requires no reboots. Using AWS Security Hub as your dashboard, you can aggregate and prioritize security alerts from Falcon and Amazon GuardDuty to protect Amazon EC2 instances or containers running on Amazon ECS and Amazon EKS.

KEEP AMAZON EC2 INSTANCES SECURE AND PERFORMANT

Falcon uses cloud-native scaling to secure Amazon EC2 instances with minimal impact on runtime performance, and no storm scans or invasive signature updates. It provides protection against all advanced attacks that bypass traditional perimeter and signature-based approaches.

PROTECT CONTAINERS RUNNING ON AMAZON ECS AND AMAZON EKS

Falcon runs on the Amazon EC2 instance node, protecting all containers running on it, including those managed by Amazon ECS and Amazon EKS. From known malware to the most sophisticated attacks, Falcon protects containers through workload monitoring and discovery, looking at parameters such as the container's unique identifier and configuration type, then funnels alerts to AWS Security Hub.

SHIFT CONTAINER SECURITY LEFT WITHIN CI/CD PIPELINES

Moving security tasks earlier in the software development lifecycle enables teams to discover flaws before they take a major toll. By adding Falcon to your CI/CD deployment workflows, you gain runtime security for Amazon ECS and Amazon EKS workloads, as well as visibility into containerized applications. View and manage events like risky container images through the AWS Security Hub dashboard.

DEVOPS TEAMS CAN CODE MORE EASILY

- ✓ Achieve malware protection without integrating a legacy appliance
- ✓ Simplify code and scripts with a single agent that attaches seamlessly

SECURITY TEAMS IMPROVE UNDERSTANDING

- ✓ Correlate AWS alerts with Falcon detection for faster triage and remediation
- ✓ Provide an integrated proactive threat hunting platform for the operations team

BETTER VALUE

Efficiency gains from Falcon and AWS Security Hub working in tandem help you speed time to detection, investigation, and remediation to stop breaches. Integrated service for full security means a more efficient team that spends less time managing separate workstreams. Maximize the power of AWS Security Hub to aggregate events by leveraging the threat intelligence and simplified architecture of cloud-native Falcon platform.

SIMPLIFY AWS DEPLOYMENTS AND MIGRATIONS

Other security vendors often require complex routing for legacy applications that must be inserted into the packet flow, and numerous workload agents to provide antivirus, EDR, and container security that are separately installed and managed. This can add complexity to your AWS environments and increase downtime. As a single agent, Falcon delivers the same level of security with less overhead.

SPEED RESPONSE TIMES

Prioritized incidents within AWS Security Hub help streamline the triage process, allowing your team to address the most critical threats first.

BOOST EFFICIENCY FOR GREATER COST SAVINGS

The ability to procure Falcon for AWS in the AWS Marketplace allows you to take advantage of integrated metering and billing, while also optimizing spend for elastic workloads.

DEVOPS CAN GET STARTED FASTER

- ✓ Bake in security and remediation with an endpoint sensor
- ✓ Skip the installation—CrowdStrike ties in from a SaaS-based console
- ✓ Bootstrap one single security service for total protection

CLOUD ARCHITECTS STREAMLINE DESIGNS

- ✓ Consolidate architecture for simpler builds

100,000 NODES
